	<i>In practice, the myth that childhood obesity is impossible to treat justifies doing Nothing. Most obese children do not become obese adults. 74 % of obese infants and children were not obese 20 years later. Obese adults with onset in childhood or adolescence tend to be fatter than those who became obese as adults. At both lunch and dinner, the obese boys consumed more food than their nonobese brothers.</i>

D. N. Clinton	Why do eating disorder patients drop out? <i>Lack of congruence between patients' and therapist's expectations of potential Treatment interventions was associated with increased risk of dropout, whereas other patient-, therapist- and treatment-specific factors were not. In particular, dropouts had significantly greater expectations of being helped by insight-related interventions than their therapists. Conclusions: Dropout among eating disorder patients appears to be related to the patient-therapist relationship.</i>	Psychother Psychosom	65; 29 – 35 1996 (G)

D. Flanagan/ H. Wagner	Expressed emotion and panic-Fear in the prediction of diet treatment compliance	British Journal of Clinical Psych.	30; 231-240 1991 (O)

The results indicated that the obese patients showed more anxiety (measured by the panic-fear scale) than did the control subjects. Compliant patients had lower panic-fear scores than did non-compliant patients, and patients living with a high EE relative were much less likely to comply with treatment than were those living with a low EE relative. Patients with a high EE relative were more likely to have a high panic-fear score. The results suggest that dietary treatments for obesity need to be

accompanied by both individual and family behavioural interventions.

„Sehr interessanter Artikel als Gegenpol zur Theorie Adipositas hat keine psychologische Gründe.“

J. Fleming/ G. Szumkler	Attitudes of medical professionals towards patients with eating disorder. <i>Journal of Psychiatry</i> 352 medical and nursing staff in a general hospital. Patients with eating disorders were less liked than patients with schizophrenia and were seen as responsible for their illness almost to the same degree as recurrent overdose takers. Factor analysis showed a first factor in which patients with eating disorders were construed as vulnerable to external pressures (from others, the media) while also self-inducing their illness, and this was associated with treatment recommendations for education, urging the patient to take self-control and psychotherapy. The professions differed significantly in attitudes.	Australian and New Zealand	26; 436-443 1997 (G)

- The resulting conclusion, that obesity does not carry risk for psychological problems, is in line with clinical impression, reports showing strong cultural bias and negative attitudes towards obese persons. First generation of studies in the field and a second generation of studies begin with a risk factor model to identify the individuals who will suffer from their obesity. A third generation of studies causal pathways linking obesity to specific areas of distress.

- R. Gallop/S. Kennedy Therapeutic alliance on an inpatient unit for eating disorders Int. Journal of eating disorders Vol. 16; No. 4 405 – 410 1994 (G)
- D. Stern *The therapeutic alliance as measured by the working alliance inventory was examined on an inpatient unit for eating disorders. Unit staff and patients (n = 33) admitted within a 2-year period completed the rating scales at 3 weeks after admission and again at 8 weeks. The perception of the alliance strengthened over time for patients while staff perceptions did not. Little correlation was observed between staff and patient perceptions of the alliance.*

	<i>Biologische Faktoren, Verhalten, Kognitionen und Emotionen, Beziehungsgestaltungen Sowie die Psychodynamik sollten berücksichtigt und nötigenfalls verändert werden. Während für den klinischen Fall Selbstwertstörungen des Adipösen von zentraler Bedeutung sind, lassen sich im Experiment Selbstwertstörungen Stigmatisierter (Adipöser) selten nachweisen. In einer Befragung gleichermassen adipöser Therapie- williger und Nichttherapiewilliger finden wir Hinweise darauf, wie sich die kognitiven Prozesse bei beiden Gruppen unterscheiden und unterschiedliche Effekte der äusser- lichen, gewichtsbedingten Stigmatisierung hervorrufen. Selbstwertminderung bei stigmatisierten Minoritäten kaum nachweisbar.</i>

L. Schachter/	Futility and avoidance: Medical professionals in the treatment of obesity <i>Dr. Frank compares physicians attitudes toward obesity with their attitudes toward Other chronic disorders. If obesity is to be treated in the same manner as any Other chronic disorder, it is vital that treatment protocols be formed and made Known. New York State has recently passed legislation that protects consumers From quackery and false claims made by the weight-loss industry. Viewing obesity From a biopsychosocial perspective helps one to appreciate the complex interaction Of metabolic and genetic components as well as the importance of the family and Social and cultural context. Recent evidence from smoking-cessation research suggests that physician intervention can be a powerful motivation for change. Current scientific evidence shows that people who eat a high-fat diet are more likely To become obese than others and supports the premise that diet's role in obesity Goes beyond a simple caloric excess of energy output.</i>	JAMA	Vol. 270, No. 12, Sept. 22/29, 1993 (O)
